

Boon

In this Lab, I have learned how to use the github command line instead of only relying on using github gui on the website. I also learn the workflow of the github project such as creating a new file as well as push and commit the change. But most importantly I learned about the branch and real issues like merge conflicts. These exercises make me understand how github works.

Ryuki

This lab helped me understand different git commands and explore the capabilities of the command line git. I have learned that using the git command line makes me a lot more careful with my actions while also providing useful feedback messages. Using git status also provided clear feedback on the state of the files which make it much clearer than using gui. I also learned several useful features like how to safely rollback and merge files.

Pepper

In this week's lab, I learned how to use the git command line to control project versions. I practiced making and changing branches, which let me try new things without breaking the main code. I also learned what to do when there is a merge conflict, so I can fix problems when two changes happen at the same time. This lab made me more confident to use git in real projects and not just in class examples.

Thiri

I have learned to use git via command line in this lab. Now, I am more confident to use git in an entire workflow, from creating a personal token to configure the git to using various git commands in different scenarios to collaborate with teammates. I used to be very anxious about dealing with merge conflicts. Through this lab, I practiced resolving them and became more comfortable with team collaborating.

Group

Most of the group members learned a lot of github workflow and command line through exercises in this lab. We also learned how important github is to project and coding due to its features, especially version control. Overall, our group members have a better understanding and clearer ideas on how to use github to help our project workflow through this lab.
